Attack Distribution by Time Bucket

Most Targeted Destination IPs

Attack Distribution by Attack Category

Overall Network Risk Level Distribution

Risk ● High ● Low ● Medium

Attack Trend by Hour

Key Insights:

1. Almost all network traffic (**99.8%**) is attack traffic, showing a serious network problem.
2. Most communication happens through the TCP protocol, indicating attacks follow a common method.
3. A small number of source IPs generate most of the traffic, suggesting possible attackers.
4. Some destination systems receive higher traffic, indicating targeted attacks.
5. Certain ports and services show higher activity, meaning they are commonly targeted.
6. Traffic varies across different time periods, showing attack patterns and bursts.
7. A large portion of traffic falls under the high-risk category, indicating serious security threats.
8. Some source IPs show abnormal spikes in traffic, indicating suspicious or attack behavior.

CONCLUSION

The network shows dominant attack traffic from a few sources targeting specific systems, requiring immediate actions like IP blocking and intrusion detection.
